New England Power Grid 2023–2024 Profile

The region's wholesale electricity marketplace is securing reliable electricity at competitive prices and helping usher in a cleaner, greener grid.

A Major Energy Transformation Is Underway

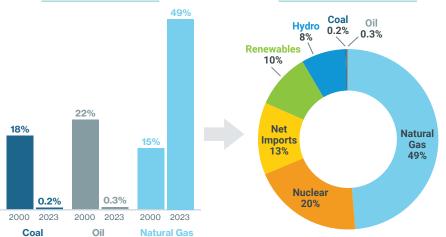

New England has shifted away from older coal- and oil-fired generation to cleaner burning natural gas.

Most of today's electricity production comes from lower-emitting energy resources.

2023 ENERGY RESOURCES

The region is transitioning to large-scale clean and renewable energy.

to cleaner burning natural gas. YESTERDAY VS. TODAY 49%

LOOKING TO THE FUTURE

Wind power new resource proposals continue to account for nearly half of the interconnection request queue: nearly 17,600 MW

Solar power is growing rapidly: ISO-NE forecasts nearly 12,000 MW within a decade

Battery storage technologies dominate new resource proposals: more than 18,000 MW proposed

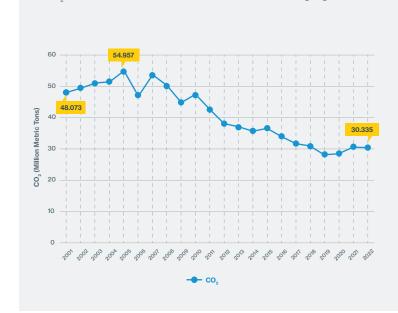

New transmission proposals would provide access to additional clean or renewable energy in New England or Eastern Canada

erage Annual Price of Wholesale

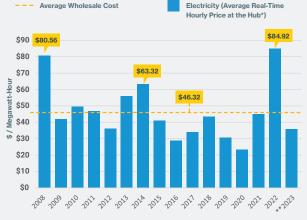

The amount of electricity produced by generators in New England and imported from other regions to satisfy all residential, commercial, and industrial customer demand in New England. This is called Net Energy for Load (NEL).

Major Emissions Reductions

CO₂ emissions declined with shift from coal and oil to natural gas generation

Wholesale Prices Drop Sharply After Historic High

* The Hub is a collection of 32 locations in New England used to represent an uncongested price for electric energy.

** 2023 data are subject to adjustments.

Electrification Will Drive Electricity Demand

In New England, demand for electricity peaks in the summer; a smaller peak occurs in the winter. Records: 28,100 MW in summer and 22,800 MW in winter.

While state-sponsored energy-efficiency (EE) and behind-the-meter solar photovoltaic (PV) programs are slowing growth, the ISO forecasts that both energy usage and peak demand will increase slightly in New England over the next 10 years. The primary factors for this increase are the new electrification forecasts for electric vehicles and air-source heat pumps.

Forecasted annual growth rates for New England through 2032

	Without EE & PV	With EE & PV
PEAK DEMAND (50/50 SUMMER PEAK):	1.2%	1.10%
OVERALL DEMAND:	2.4%	2.3%

New England has nearly 31,000 megawatts (MW) of installed electricity generating capacity

The power generation resource mix is transitioning to a fleet powered by natural gas, and renewable energy.

Generation Retirements

Coal- and oil-fired power plants make up 22% of the region's electricity generating capacity, but tend to be used only during peak demand periods and are retiring.

More than 7,000 MW of generation have retired since 2013 or may retire in the next few years.

Proposed Generation

Developers have proposed 39,863 MW of new generating resources as of January 2024.

About 9,000 miles of high-voltage transmission lines span the six states. The ISO is working with the New England states to evaluate potential future transmission needs to identify, at a high-level, transmission infrastructure necessary to meet the New England states' energy policies, mandates, or legal requirements.

Imported Power

On an annual basis, New England is generally a net importer of electricity via interconnections with neighboring power systems in New York, Quebec, and New Brunswick.

Percentage of net energy from imports

19%	21%	16%	14%	13%
2019	2020	2021	2022	2023

Merchant transmission companies, electric utilities, and renewable energy developers are proposing several projects to deliver low- or noncarbon-emitting resources into the New England market, totaling approximately 13,000 MW.

Wind Power

Roughly 1,400 MW of wind power is operational in the region. Developers are proposing nearly 18,000 MW of additional wind power, primarily offshore in southern New England.

Solar Power

State policies are promoting development of behind-themeter distributed resources, specifically solar PV resources.

ISO-NE Draft 2024 Solar PV Forecast

Adding renewable resources will displace fossil-fueled resources and help achieve state policy objectives. This will require fast-responding resources like grid-scale energy storage to help balance the variability of renewables.

About ISO New England

of the region's wholesale electricity markets, and managing comprehensive regional electric power planning.
